

KSB White Glove Service

User Manual — Version 2.0

Comprehensive guide to the KSB White Glove premium vehicle service management platform. Covers the web application, iOS companion app, customer-facing tools, and the shop Health Board.

Platform	Web (Next.js) + iOS (SwiftUI)
Deployment	Vercel (web) + TestFlight (iOS)
Database	Supabase (PostgreSQL)
Version	2.0 — August 2026

12.4 Inspections & Camera

12.5 Damage Markers

12.6 Appointments

13. Notifications & Alerts

1. Getting Started

1.1 Logging In

Navigate to your organization's White Glove URL (e.g., **white-glove-auto-service.vercel.app**). The login page displays the KSB White Glove branding and a staff picker showing all team members. Tap your name to sign in instantly. On the iOS app, the same staff picker appears with role icons (gear for Shop Manager, monitor for Service Advisor, wrench for Technician).

The staff picker is for development/demo use. Production deployments can use email/password authentication via Supabase Auth.

1.2 User Roles & Permissions

White Glove uses role-based access control. Each user is assigned a role through their organization membership. The system enforces row-level security (RLS) at the database level, ensuring users only see data belonging to their organization.

Role	Access Level	Key Capabilities
Shop Admin	Full access	All features, team management, org settings, reports, health board
Service Advisor	Service operations	Vehicles, service requests, estimates, approvals, scheduling, reports
Technician	Work execution	Assigned vehicles, service requests, inspections, checklists
Delivery Specialist	Delivery workflow	Vehicles, delivery checklists
Customer	Self-service	Approval page, booking page, vehicle status (via links)

1.3 Navigation Overview

The web application features a fixed left sidebar with the KSB White Glove logo at the top (which links back to the Dashboard), followed by navigation items organized by function. The sidebar collapses on mobile devices into a hamburger menu. Your profile and role are displayed at the bottom with a Log Out button.

Feature	Description
---------	-------------

Dashboard	Overview KPIs, recent vehicles, service request summary
Vehicles	Full vehicle inventory with status, customer, and VIN
Service Requests	Active and historical service work orders
Inspections	Multi-point inspections with photo documentation
Checklists	Delivery and QC checklists
Customers	Customer directory with contact info and history
Schedule	Weekly calendar view of technician assignments
Appointments	Manage customer appointment bookings
Reports	Analytics dashboard and PDF report generation
Health Board	Full-screen TV display of shop performance
Notifications	In-app notification center
Settings	Organization, team, canned jobs, and audit log

2. Dashboard

The Dashboard is the landing page after login. It provides an at-a-glance overview of shop operations with KPI cards, a recent vehicles table, and a service request breakdown.

2.1 KPI Cards

The top row displays key metrics in card format:

- **Active Vehicles** — Count of vehicles currently in the shop
- **In Service** — Vehicles with active service requests
- **Pending Approval** — Estimates awaiting customer response
- **Ready for Delivery** — Completed vehicles awaiting pickup
- **Revenue** — Total billed amount for the current period
- **Customers** — Total customer count

2.2 Recent Vehicles

Below the KPIs, a table shows recently active vehicles with columns for Year/Make/Model, VIN (last 6), Customer, Status (color-coded badge), and Last Updated. Click any row to navigate to the vehicle detail page.

2.3 Service Request Summary

A breakdown of service requests by status is displayed, showing counts for each stage: Draft, Submitted, Awaiting Approval, Approved, In Progress, QC, Ready for Delivery, and Completed. Each status has a distinct color badge.

3. Vehicle Management

3.1 Vehicle List

The Vehicles page displays all vehicles in a sortable, searchable table. Each row shows the vehicle's year, make, model, trim, color, VIN, associated customer, status badge, and mileage. Use the search bar to filter by any field. The status badges use consistent color coding throughout the app:

Feature	Description
Intake Started	Blue — Vehicle check-in has begun
Intake Completed	Teal — All intake documentation finished
In Service	Gold — Active work being performed
Awaiting Approval	Amber — Estimate sent to customer
Ready for Delivery	Green — Work complete, awaiting pickup
Delivered	Gray — Vehicle returned to customer

3.2 Adding a New Vehicle

Click **" + New Vehicle "** from the Vehicles page or use the intake flow. The vehicle form captures: Year, Make, Model, Trim, Color, VIN, License Plate, State, Mileage, Engine, Transmission, Drivetrain, and optional notes. Select an existing customer or the system will associate one later.

3.3 VIN Decoder

When entering a VIN, the system automatically queries the NHTSA VIN decoder API to populate Year, Make, Model, Trim, Engine, Transmission, and Drivetrain fields. This eliminates manual entry errors and speeds up the intake process. The decoder handles standard 17-character VINs.

3.4 Vehicle Detail View

The vehicle detail page is organized into tabs: **Overview** (vehicle info, customer, status), **Service History** (all service requests for this vehicle), **Inspections** (inspection records), **Media** (photos and documents), and **Activity** (audit timeline). The header shows the vehicle's photo (if uploaded),

year/make/model, and current status with a quick-action button to create a new service request.

4. Service Requests

4.1 Service Request List

The Service Requests page shows all work orders with filterable status tabs. Each row displays the title, vehicle (year/make/model), customer, assigned technician, status badge, priority, and total amount. Click any row to open the detail view.

4.2 Creating a Service Request

Create a new service request from the vehicle detail page or the service requests list. Fill in the title, description, assign an advisor and technician, set priority (1-5), and optionally set an estimated completion date. The request starts in **Draft** status and moves through the workflow as work progresses.

4.3 Estimate Builder & Line Items

The service request detail page includes a full estimate builder. Add line items with:

- **Type** — Labor, Parts, Sublet, Fee, or Discount
- **Description** — What the work or part is
- **Quantity & Unit Price** — Auto-calculates line total
- **Technician Assignment** — Who performs the work
- **Status** — Pending, Approved, Declined, In Progress, Completed

The estimate displays a running subtotal, configurable tax rate (from org settings), tax amount, and grand total. Line items can be reordered via drag handles.

4.4 Canned Jobs

Canned jobs are pre-configured service packages (e.g., "Oil Change", "Brake Pad Replacement") that can be added to any estimate with one click. Each canned job includes a description, line type, default quantity, and unit price. Manage canned jobs from **Settings > Canned Jobs**. When adding a line item to an estimate, click **"Add from Canned Jobs"** to browse and select.

4.5 Customer Approval Workflow

When an estimate is ready, click **"Send for Approval"** to generate a secure approval link. The system sends an SMS (via Twilio) and/or email (via Resend) to the customer with the link. The customer sees a branded approval page showing all line items with prices. They can:

- Approve all items
- Decline specific items (partial approval)
- Add comments

The service request status updates automatically based on the customer's response. Declined items are tracked in the declined jobs history for future re-recommendation.

5. Inspections

5.1 Inspection Types

The platform supports six inspection types, each with customizable sections and items:

Feature	Description
Intake	Initial vehicle condition assessment at check-in
Mechanical	Engine, brakes, suspension, drivetrain evaluation
Cosmetic	Paint, body, interior condition documentation
Delivery	Pre-delivery quality verification
Quality Control	Post-repair verification before customer handoff
Spot Check	Quick targeted inspection of specific concerns

5.2 Conducting an Inspection

Each inspection is organized into sections (e.g., "Exterior", "Engine Bay", "Interior"). Within each section, individual items can be marked as Pass/Fail with optional notes. Items can be flagged for attention, which highlights them in reports. The inspection tracks completion percentage and can be signed off when finished.

5.3 Damage Markers

The damage marker tool provides a vehicle silhouette diagram where you can tap/click to place markers indicating damage locations. Each marker captures: label, description, severity (Minor/Moderate/Severe), and can be linked to photos. The markers display on both the web and iOS apps, synced in real time.

5.4 PDF Inspection Reports

Generate professional PDF inspection reports with one click. The report includes: vehicle details, inspection metadata, all sections with pass/fail results, flagged items highlighted in red, inspector notes, and the completion timestamp. Reports can be shared with customers via email or printed for shop records.

6. Scheduling & Appointments

6.1 Schedule Calendar

The Schedule page shows a weekly calendar grid with technician rows and day columns. Service requests assigned to each technician appear as color-coded cards on their respective days. The view helps service advisors balance workload across the team and identify scheduling gaps.

6.2 Appointments Management

The Appointments page lists all booked appointments with date/time, customer name, vehicle, service type, and status. Appointments can be confirmed, rescheduled, or cancelled. The system automatically sends confirmation emails to customers.

6.3 Customer Booking Page

The customer-facing booking page (**/book**) allows customers to request service appointments without logging in. The multi-step form collects:

- **Step 1** — Customer information (name, email, phone)
- **Step 2** — Vehicle details (year, make, model, VIN)
- **Step 3** — Service selection and description of concerns
- **Step 4** — Preferred date and time slot

The booking page uses the KSB White Glove branding and is accessible without authentication. Submitted bookings appear in the Appointments management page for staff review.

7. Delivery & Follow-up

7.1 Delivery Checklists

Before a vehicle is returned to the customer, the delivery specialist completes a delivery checklist. The checklist includes items like: vehicle cleaned, all personal items returned, tire pressure checked, fluid levels verified, walk-around completed with customer, and customer signature captured. Each item is checked off individually with a progress bar showing completion percentage.

7.2 Google Reviews Follow-up

After delivery, the system can trigger a follow-up flow encouraging the customer to leave a Google Review. The review request page displays the shop's branding and a direct link to the Google Business listing. This helps build the shop's online reputation with genuine customer feedback tied to actual service visits.

8. Health Board (TV Display)

The Health Board is a full-screen display designed for a shop TV. It shows real-time shop performance metrics without requiring login, using the KSB dark graphite (#0d0d14) background with gold (#c8a45c) accents. The display auto-refreshes every 30 seconds. Access it at [/health-board](#).

The Health Board uses a deliberate color system designed for shop environments: gold for on-track, white/gray for tight, orange for at-risk or blocked, and red for overdue. Green is intentionally avoided because it washes out under fluorescent shop lighting.

8.1 Pulse KPIs

The top row displays five key metrics across the full width:

Feature	Description
On-time Delivery	Percentage of vehicles delivered by their promised date (last 30 days). Trend arrow shows
Vehicles Active	Count of vehicles currently in the shop, shown against total bay count.
At Risk	Count of vehicles where remaining labor + buffer exceeds time until promised delivery. Sh
Aging (5+ Days)	Vehicles that have been in the shop for 5 or more days. Helps identify stalled work.
Comebacks (30D)	Rework count in the last 30 days. Shows clean streak in green when zero.

8.2 Technician Lanes

Below the pulse row, each technician gets a horizontal lane showing their assigned jobs as cards. Each card displays:

- **Vehicle** — Year, make, model
- **Service title** — What work is being done
- **Phase badge** — Diagnosis, Scoped, Active, Parts Hold, QC, or Done
- **Time remaining** — Hours of labor left, or ETA for parts
- **Health color** — Left border indicates on-track (gold), tight (gray), at-risk (orange), or overdue (red)

Lead techs are labeled as such. If a technician is marked unavailable for the day, an "OUT" indicator appears. Lanes scale horizontally — more jobs scroll right.

8.3 Delivery Timeline

The bottom section shows a 7-day timeline (Today through next Tuesday) with horizontal bars for each vehicle that has a promised delivery date. The bars show:

- **Completed work** — Lighter gold fill showing progress
- **Active work** — Darker gold fill for remaining labor
- **Parts hold** — Dashed orange segment when waiting for parts
- **Promise date marker** — Vertical gold line at the delivery target

Overdue vehicles show their promise date marker in red.

8.4 Parts & Phase Tracking

The Health Board integrates with the new parts tracking system added in the schema migration. Each repair order line item can now track:

- **Parts Status** — Not Needed, Ordered, Backordered, Received
- **Parts Tier** — Local (same day), Domestic (1-3 days), Factory (5-10 days), Fabrication (custom timeline)
- **ETA Days** — Anticipated days until parts arrive
- **Work Phase** — Diagnosis → Scoped → Active → Hold → QC → Complete

Discovery (scope expansion) is tracked as a first-class event. When a technician finds additional work during diagnosis, a discovery service request is created with a link to the parent request. This freezes the clock on the original promise date.

9. Reports & Analytics

9.1 Analytics Dashboard

The Reports page shows an analytics dashboard with real-time data from Supabase. Key visualizations include: vehicles by status (bar chart), service requests over time, revenue breakdown, technician workload distribution, and inspection completion rates. All data is scoped to the current user's organization.

9.2 PDF Estimate/Invoice Reports

Generate professional PDF estimates and invoices from any service request. The report includes: shop logo and contact info, customer details, vehicle information, itemized line items with labor/parts breakdown, subtotal, tax (using the org's configured rate), and grand total. Reports can be downloaded or shared via email.

9.3 Audit Event Log

The audit log (Settings > Audit Log) records every significant action in the system. Events include: vehicle check-ins, technician assignments, inspection completions, estimate creation, customer approvals/declines, repairs started/completed, parts ordered/received, QC checks, deliveries, and more. Each event captures the actor, timestamp, entity affected, and a diff of what changed. The log is searchable and filterable by action type, actor, and date range.

10. Settings & Administration

10.1 Organization Settings

Configure your organization's details from **Settings > Organization**. Fields include: shop name, phone, email, address, logo upload, default tax rate, business hours (for booking availability), and the new Health Board settings: default buffer hours (extra time added to delivery estimates) and bay count (displayed on the Health Board pulse).

10.2 Team Management

The Team page (**Settings > Team**) shows all organization members with their name, email, role, and active status. Admins can: invite new team members via email, change roles, deactivate members (preserving their history), and manage permissions. Each role determines which navigation items and features are accessible.

10.3 Canned Jobs Library

The Canned Jobs page (**Settings > Canned Jobs**) manages reusable service templates. Create jobs with a name, description, line type (labor/parts/sublet), default quantity, and unit price. Jobs can be edited, deleted, or toggled active/inactive. When building an estimate, the canned job picker shows these templates for quick addition.

11. Customer-Facing Features

11.1 Approval Page

When an estimate is sent for approval, the customer receives a link to a branded page at **/approve/[token]**. The page shows the KSB logo, vehicle details, and all proposed line items with prices. The customer can approve/decline individual items and add comments. The page works without authentication — the secure token in the URL provides access. Approval links expire after a configurable period.

11.2 Booking Page

The public booking page at **/book** allows customers to request service appointments. It uses a multi-step wizard with the KSB branding. No login required. Submitted appointments are visible to staff in the Appointments management page.

11.3 SMS Notifications

The system sends SMS messages via Twilio for key events: approval requests, appointment confirmations, vehicle status updates, and delivery notifications. Messages include relevant links (e.g., approval page URL). SMS is configured with the shop's Twilio credentials in the environment variables.

11.4 Email Notifications

Email notifications are sent via Resend for: new service request creation, estimate ready for approval, customer approval/decline responses, service completion, and delivery ready notifications. Each email uses a branded HTML template with the KSB styling. Email addresses are pulled from the customer record.

12. iOS Companion App

The iOS app is a SwiftUI companion designed for technicians and advisors working in the shop. It connects to the same Supabase backend as the web app, so all data stays in sync. Available via TestFlight for beta testing.

12.1 Staff Login

The iOS app features the same staff picker as the web app, with role-specific icons. It authenticates directly against Supabase Auth. If the test-login API is unreachable (e.g., network issues), it falls back to direct Supabase sign-in with the staff credentials.

12.2 Vehicle List & Detail

The vehicle list shows all organization vehicles in a scrollable list with status badges. Pull-to-refresh updates the data. The detail view has tabs for Overview, Service Requests, Inspections, and Activity — matching the web app's layout.

12.3 Intake Wizard

The intake wizard guides technicians through vehicle check-in with a step-by-step flow: customer selection, vehicle identification (with VIN scanning), mileage and condition notes, photo capture, and submission. Photos are uploaded to Supabase Storage.

12.4 Inspections & Camera

Technicians can conduct inspections on their iPhone/iPad with the native camera for photo documentation. Each inspection item can have photos attached directly from the camera. Pass/fail toggles and notes are synced to the server in real time.

12.5 Damage Markers

The iOS damage marker view mirrors the web version — a vehicle silhouette where technicians can tap to place damage indicators with severity levels and descriptions. Markers sync bidirectionally with the web app.

12.6 Appointments

View and manage appointments from the iOS app. The appointments list shows upcoming bookings with customer info, vehicle details, and service type. Supports confirming and cancelling appointments.

13. Notifications & Alerts

The notification center (bell icon in sidebar) aggregates all system notifications for the current user. Notification types include:

Feature	Description
Intake Started	A new vehicle has been checked in
Intake Completed	Vehicle check-in documentation is complete
Approval Needed	An estimate needs your review/approval
Approval Received	Customer has responded to an estimate
Service Started	Work has begun on a service request
Service Completed	Service work has been finished
Delivery Ready	Vehicle is ready for customer pickup
Vehicle Delivered	Vehicle has been returned to the customer
Issue Flagged	A technician has flagged an issue for attention
Report Ready	A PDF report has been generated

Notifications are marked as read when opened. The sidebar shows an unread count badge. Critical notifications (approvals, flags) also trigger email and/or SMS delivery depending on the recipient's preferences.
